

What's next for the International Space Station?

The International Space Station has recently doubled its crew from three to six astronauts. As the ISS transitions from its construction phase to its utilization phase as a U.S. national laboratory in space, what are we learning and what scientific discoveries are being made? Please join the Aerospace Industries Association as we host a panel discussion on the current status of the international space station, its science, its unique role as a laboratory in space, and the benefits it brings our nation and the world.

**Thursday, August 13, 2009
10:00-11:00 a.m.
2318 Rayburn Building**

Featuring
